CREAMINO

ENERGY FOR HEALTHY GROWTH

Quick Facts Turkey

POWER UP YOUR FEED – IMPROVE PERFORMANCE

High growth rates and breast muscle development place substantial demands on energy metabolism in turkeys. Creatine plays a key role in cellular energy metabolism by supporting the rapid regeneration of ATP – the cell's immediate energy source.

Predominantly plant-based diets contain little or no creatine, increasing the reliance on endogenous synthesis to maintain adequate cellular creatine concentration.

Creamino® provides guanidinoacetic acid (GAA), the direct precursor of creatine. Adding Creamino® to the diet results in adequate levels of creatine in the animal's body.

By supporting efficient energy metabolism, Creamino® helps to promote growth, feed efficiency and breast meat yield throughout the production cycle.

MAXIMIZE PERFORMANCE OR OPTIMIZE FEED COSTS

ON TOP: maximize performance by increasing body weight gain and breast meat yield and improving FCR.

REFORMULATION: optimize feed costs without sacrificing performance by using the energy and/or arginine sparing potential of Creamino®.

Areas of application	Benefit	Proven by studies or customer feedback	Typical numbers
Performance on top approach	Final body weight	Reports from commercial applications, 146 days of age	+250 to 500g
	FCR	Data observed on turkeys 20 weeks old	-5 to -8 points
	Breast meat weight	Proven by commercial applications, 140 days of age	+250g

We and our partners are happy to support you in finding the best approach for your individual situation. Observe the locally relevant regulations for the feed additive.
